

First-order conditional singular series $\mathfrak{S}_{2,\omega}(d)$ vs observation in S_{10} (23,988,173 twin centres)

Theory = $C_2(d) \times$ lockdown-allowance over the stratum's real centre factors. Matches 30/42/60 and the direction of 210; the systematic high- ω residual on 210 (shaded, stable across S_9/S_{10}) is the second-order open problem.
